***Examiner's Reasons for Allowance***

The following is an examiner's statement of reasons for allowance:

Referring to claims 1-21, the prior art searched and of record neither anticipates nor suggests in the claimed combinations, encoding into a symmetric resolution format, halftone dots which have been optimized by designed into an asymmetric shape (or pattern) before encoding, in such a way that a printer's imbedded (or native) binary resolution conversion algorithm is used to decode these encoded asymmetric halftone dots into high resolution symmetric binaries.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

***Cited Art***

The art made of record and not relied upon is considered pertinent to applicant's disclosure.

Lund et al (US 6804417 B1 and US 6650793 B1) disclose algorithms that convert 600x600 dpi input resolution data to 1200x600 dpi output resolution image data or 300.times.300 to 600.times.300 dpi resolution (i.e., asymmetric 2:1 ratio resolution conversion along mutually perpendicular axes), including text edge smoothing, while causing minimal change to gray scaled (halftoned) data within images. The techniques can be applied to other resolutions as well.

Art Unit: 2626

de Queiroz (US 6175653 B1) discloses a combination of image compression and image rotation with decompression for devices with asymmetric resolution. The rotation and scaling are built into the decompressing process to avoid spending time and effort in scaling and rotating the decompressed image.
